### **Target users**

- Residents in Singapore
- Tourists to Singapore
- Hawkers in Singapore

### **Functional Requirements**

- 1. The users must be able to create an account of their respective domain.
  - 1.1. The users can only create one account with one email address.
  - 1.2. The users must be able to click on the sign-up button.
  - 1.3. The customers must provide their valid email address and valid password to sign up for an account.
    - 1.3.1. The system must verify all required fields have been filled out.
    - 1.3.2. The input email address must be in a valid format.
    - 1.3.3. The system must display an error message if the email address is not in a valid format.
    - 1.3.4. The password must contain at least one upper case letter, one lower case letter, and one number.
    - 1.3.5. The length of the password must be at least 8 characters.
    - 1.3.6. The system must display an error message if the password does not match the requirement in 1.3.4. and 1.3.5..
    - 1.3.7. The customers must input the same password twice as a confirmation stage.
    - 1.3.8. The system must display an error message if the input passwords are not the same.
    - 1.3.9. The system must send a confirmation email to the registrar upon successful registration of a new account.
  - 1.4. The hawkers must provide their valid email address, valid password and a valid operating license to sign up for an account.
    - 1.4.1. The system must verify all required fields have been filled out.
    - 1.4.2. The input email address must be in a valid format.
    - 1.4.3. The system must display an error message if the email address is not in a valid format.
    - 1.4.4. The password must contain at least one upper case letter, one lower case letter, and one number.
    - 1.4.5. The length of the password must be at least 8 characters.

- 1.4.6. The system must display an error message if the password does not match the requirement in 1.4.4. and 1.4.5..
- 1.4.7. The hawkers must input the same password twice as a confirmation stage.
- 1.4.8. The system must display an error message if the input passwords are not the same.
- 1.4.9. Admin must be able to approve the validity of the license.
- 1.4.10. The system must automatically send a confirmation email to the registrar upon successful registration of a new account.
- 2. The users must login to the system with the correct email address and password before performing all the tasks.
  - 2.1. The system must verify that both fields have been filled out.
  - 2.2. The system must display an error message if the login information is wrong.
  - 2.3. The users will be able to reset their password if they forgot their password by clicking on the "Forgot password?" button.
    - 2.3.1. The system will send a link to the reset password website through email to the user after clicking on the "Forgot password?" button.
      - 2.3.1.1. The password must contain at least one upper case letter, one lower case letter, one symbol and one number.
      - 2.3.1.2. The length of the password must be at least 8 characters.
      - 2.3.1.3. The users must input the same password twice as a confirmation stage.
      - 2.3.1.4. The system must display an error message if the password does not match the requirement in 2.3.1.1. and 2.3.1.2.
      - 2.3.1.5. The system must display an error message if the input passwords are not the same.
- 3. The hawkers must be able to update the information related to the stall.
  - 3.1. The hawkers must be able to update the opening hours and operating days of the stalls.
    - 3.1.1. The system must display the opening hours in 12-hour notation with AM and PM.
  - 3.2. The hawkers must be able to update the menu of the stalls.
  - 3.3. The hawkers must be able to see the ratings of the stalls.
    - 3.3.1. The ratings should be displayed in number of stars.
  - 3.4. The hawkers must be able to see the reviews of the stalls.

- 3.5. The hawkers must be able to see any fault reports submitted by the customers.
  - 3.5.1. The hawkers must be able to delete the fault reports after viewing.
- 3.6. The hawkers must be able to close their respective accounts about their stalls.
  - 3.6.1. The hawkers must input password two times correctly and click the "Confirm cancel" button to cancel their respective accounts.
- 4. The customers must be able to see the information about the stalls.
  - 4.1. The system must be able to show the location of the customer and hawker centers as a marker on the map.
  - 4.2. The customers must be able to click on the hawker center marker on the map.
  - 4.3. The customers must be able to see the name of a list of stalls after clicking on the hawker center icon.
  - 4.4. The customers must be able to see the opening hours and operating days of the stalls.
    - 4.4.1. The system must display the opening hours in 12-hour notation with AM and PM.
  - 4.5. The customers must be able to see the menu of the stalls after choosing the specific stall.
  - 4.6. The customers must be able to see the ratings of the stalls.
    - 4.6.1. The ratings should be displayed in number of stars.
  - 4.7. The customers must be able to see the reviews of the stalls.
    - 4.7.1. The customers must be able to click the "review" button under the stall information page.
  - 4.8. The customers must see the name of the hawker center where the stall is located.
  - 4.9. The customers must be able to see the exact address of the hawker center.
- 5. The customers must be able to make a fault report if there is any false information in the system.
  - 5.1. The system must require the customer to input at least 1 character into the text box to submit the fault report.
- 6. The customers must be able to provide their own reviews and ratings of the desired stall.
  - 6.1. The system must be able to display the options of providing ratings and reviews to the customers in the same section.
  - 6.2. The system must be able to display 5 empty stars on the screen when giving ratings.

- 6.2.1. The stars must be displayed in a horizontal straight line from left to right, with the leftmost star representing 1 star rating and the rightmost star representing 5 stars rating.
- 6.2.2. The customers must be able to click on the stars to select how many stars they want to rate the desired stall, with 0 stars being the lowest rating and 5 stars being the highest rating.
- 6.2.3. The system must automatically fill in all the empty stars prior to the star chosen by the customers, including the chosen star, with yellow color.
- 6.3. The system must be able to display a text box for the customers to input their reviews in.
  - 6.3.1. The system must display only the ratings of the customers if they did not input any characters into the text box in their submitted reviews.
  - 6.3.2. The system must display the customers' reviews below their ratings if they input at least 1 character into the text box in their submitted reviews.
- 7. The customers must be able to search the name of the stall for the location of the desired hawker center.
  - 7.1. The customers input must contain at least 1 character but less than 512 characters for the search results.
  - 7.2. The system must be able to show relevant results when the customers type in at least one character.
  - 7.3. The system must be able to display the location of the hawker center on the map.
- 8. The admin must be able to manage all the accounts of user
  - 8.1. The admin must be able to suspend account of certain user
  - 8.2. The admin must be able to activate account of certain user

### **Non-functional Requirements**

### 1. Security

- 1.1. Personal and financial data (identification details, contact information, device information) of the stalls' owner should be encrypted to prevent unauthorized access.
- 1.2. User data, including location information, search history, and personal details, should be safeguarded and not disclosed to unauthorized entities, ensuring compliance with relevant data protection regulations.

### 2. Reliability

- 2.1. The system must be able to return accurate results for all hawker centers matching the user's search queries, including partial matches and variations.
- 2.2. Information provided on the app, such as stall details should be up-to-date, accurate and consistent.
- 2.3. The search results should reflect real-time data, including hawkers' operating hours and the menu availability.
- 2.4. The system should reliably locate and display the user's accurate location on the system.

### 3. Performance

3.1. The search results should be reflected with minimal response time for users.

#### 4. Scalability

- 4.1. The system should be designed to scale efficiently, accommodating an increasing number of users as the platform grows without compromising performance.
- 4.2. The system should be able to include and manage the growing volume of data, including new stalls without much performance degradation.

#### 5. Usability

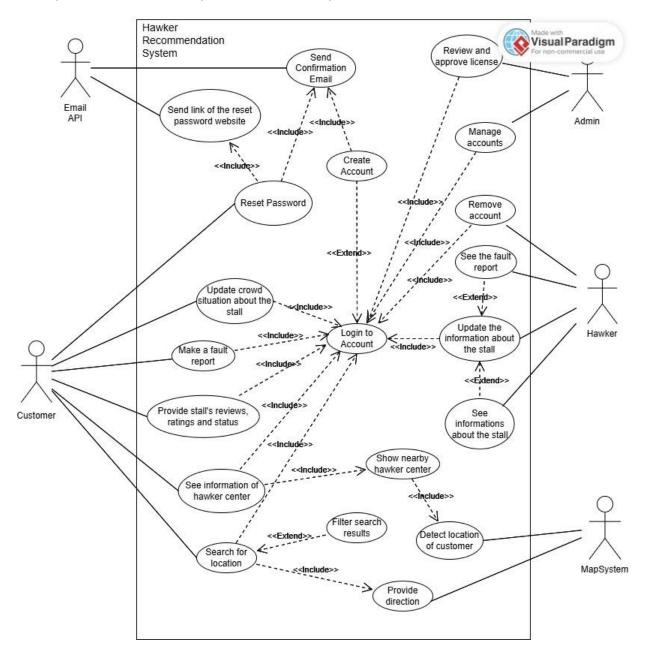

- 5.1. The system should be usable by being intuitive and simple design.
- 5.2. 80% of first-time users must be able to enter a simple search query within 2 minutes of starting to use the system.

# **Data dictionary**

Term	Definition	
Users	All the target users who are using this application to search for	
	hawker centers to get food (i.e. tourists, Singapore residents)	
Customers	The users who use the system to find food of hawker	
System	The application	
Hawker center	The place that consists of stalls that sell food	
Hawker	The owner of the stall	
Admin	The person with the highest permissions	
Stalls	The unit selling food in a hawker center	
Menu	A list of information showing the name, details, and the price of the	
	food	
Ratings	A numerical score given by the customers to show the satisfaction	
	to the stall	
Reviews	Comments given by the customers	
Empty	Indicate the icons that are filled with white color, indicating their	
	non-chosen status

# **Use Case Description**

Use Case ID:	01A		
Use Case Name:	Create a new customer account		
Created By:	Lai Xin Yee	Last Updated By:	Cho Zhi Wei
Date Created:	30-8-2024	Date Last Updated:	7-9-2024

Actor:	Customer
	Email API
Description:	Creating a new customer account
Preconditions:	System must have a stable connection to the database.
	The email address used must not already exist in the database.
Postconditions:	Show "Account created successfully" message.
	Store data of customer in database
Priority:	High
Frequency of Use:	1-3 times per lifetime
Flow of Events:	1. Customer clicks on the sign-up button.
	Customer enters a valid email address, password and password confirmation fields.
	3. Customer click the create account button.
	4. System validates the format of the email address.
	<ol><li>System validates the validity of the email address in database</li></ol>
	6. System validates the fulfillment of the requirement of the password.
	7. System validates the password and password confirmation field are identical.

	8. System displays "Thank you for signing up" message
	upon successful creation of a new customer account.
	<ol> <li>Customer ask the system to send a confirmation email to the email address.</li> </ol>
Alternative Flows:	AF-S4: System detects the invalid email address format.
	1. System displays error message "Invalid email format".
	2. System returns to Step 2.
	AF-S5: Email address exists in database:
	<ol> <li>System displays error message "Email exists, do you want to login?"</li> </ol>
	2. System returns to Step 2.
	AF-S6: System detects password does not fulfill the password requirements.
	1. System displays error message "Invalid password".
	2. System returns to Step 2.
	AF-S7: System detects mismatch between password and password confirmation fields.
	System displays error message "Password mismatch".
	2. System returns to Step 2.
Exceptions:	-
Includes:	Validate the account availability.
Special Requirements:	-
Assumptions:	Database refers to the system database.
Notes and Issues:

Use Case ID:	03A			
Use Case Name:	Hawkers update the information of the stall			
Created By:	Tan Ming Hao	Last Updated By:	Lai Xin Yee	
Date Created:	30-8-2024	Date Last Updated:	30-10-2024	

Actor:	Hawkers		
	Customers		
Description:	Hawkers update information of their respective stall		
Preconditions:	System must have a stable connection to the database.		
	Hawker account must exist in the database.		
	Hawkers want to update the information of their		
	respective stall after seeing its information.		
	OR		
	Hawkers must update the information of their respective		
	stall after seeing a fault report from the customers.		
Postconditions:	The system will update the information about the stalls.		
Priority:	Medium		
Frequency of Use:	0 – 20 times per week		
Flow of Events:	Hawker login to their respective account.		

	2. The system shows the "Fault Report" icon.
	3. The system shows the "Review" icon.
	4. The system shows the "Menu" icon.
	5. The system shows the "Opening hours" icon.
	6. The system shows "Open Shop" and "Close Shop" button.
	7. The system shows "Shut Down Shop" button.
	8. The system shows a red "X" icon.
	9. System updates the information of the stall.
Alternative Flows:	AF-S2: The hawker clicks on the fault report icon.
	1. The system displays all the reporters' fault reports.
	The system will display an exit button and a button to delete the notification.
	The system will remove the report if the customer clicks on the button to delete the notification.
	4. The system returns to Step 3 upon exit.
	AF-S3: The hawker clicks on the review icon.
	The system displays all the newly added reviews.
	2. The system displays an exit button.
	3. The hawker clicks on the exit button.
	4. The system returns to Step 4 upon exit.
	AF-S4: The hawker clicks on the "Menu" button.
	The system will show a page for the hawker to edit the menu.
	2. The hawker edits the menu of the stalls.
	3. The hawker clicks the save button.

	4. The system returns to Step 5 upon exit.
	AF-S5: The hawker clicks on the "Opening hours" button.
	<ol> <li>The system will show a page for the hawker to edit the opening hours and operating days.</li> </ol>
	2. Hawker edits the opening time and operating days.
	3. Hawker clicks on the "Save" button.

Use Case Name:	Customer provid	Customer provides stall's reviews and ratings		
Created By:	Lai Xin Yee	Last Updated By:	Chow Weng Shi	
Date Created:	30-8-2024	Date Last Updated:	31-8-2024	

Actor:	Customer		
Description:	Customer provides reviews, and ratings of the stall they visited		
Preconditions:	System must have a stable connection to the database		
	Customer account must exist in the database.		
Postconditions:	System shows "review/rating uploaded" message		
Priority:	Medium		
Frequency of Use:	1-2 times per day		
Flow of Events:	Customer search and tap on the stall that they want to provide the review or rating.		
	Customer writes in their review and choose the number of stars for ratings in the review or rating section.		
	Customer taps the "Upload" button to upload the review or rating.		
	4. System shows "review/rating uploaded" message.		
Alternative Flows:	AF–S2: Customer does not write in review and choose number stars for ratings.		
	Customer only choose the number of stars for ratings and do not input any characters into the text box.		
	2. System returns to Step 3.

# **Dialog Map**

# **System Architecture**

# **Application Skeleton**

# 1. Frontend

 We use HTML to construct the layout of our system, and CSS to design our system.

# 2. Backend

- We use Azure SQL Database as database of our system.
- We connect to Azure SQL Database with PHP using sqlsrv.
- We use JavaScript to make the logic behind our system.

# 3. API used

- Google Map API: Use in main page of customer to check location of the hawker center
- EmaiUS API: Use for sending email to customers and hawkers after account registration and 'reset password when forgot' function

# 4. Data use

 We use the data "List of Government Markets Hawker Centres" in data.gov.sg to get the address of hawker centres and mark it on our map

# 5. Folder hierarchy

- Each folder is considered a webpage with both frontend and backend
- "Login/index.html" is the entry point of the frontend of our system

# ➤ LOGIN > adminmain > ConfirmationPage > DeleteAccount > ForgotPassword > hawkerinitialize > hawkermain > Register > ResetPassword > usermain ♣ config.php ♦ index.html # login.css Js login.js ♠ login.php

1 Folder hierarchy of our system

# **Design Pattern and Considerations**

The MVC pattern is ideal for HawkerStalk because our app needs to handle user interactions, manage complex data, and display dynamic content such as reviews, fault reports, and hawker stall details. The MVC design pattern allows the app to manage complex data, diverse user interactions, and scalability demands. It creates a clear, maintainable structure that allows us to scale the functionalities of our app while keeping our code clean, organized, and easy to debug.

The MVC design pattern separates HawkerStalk's functionalities into three key concerns:

Concern	Details
Model	The model primarily contains HawkerStalk's business logic. It manages data like user accounts, hawker stalls, reviews, and fault reports. In HawkerStalk, this layer will handle (but not limited to):  • Verifying account creation for customers and hawkers • Storing reviews and fault reports • Managing hawker stall data such as opening hours, menus, and crowd levels
View	The view manages how data is presented to users.  HawkerStalk, this layer will handle (but not limited to):  • Displays user-friendly interfaces, such as the review submission page, stall information pages, and fault reporting screens.  • Show dynamic data like crowd levels, ratings, and reviews in an intuitive and visually appealing manner.
Controller	The controller bridges the gap between the view and model. It handles user input, processes data from the model, and updates the view accordingly. In HawkerStalk, the controller would (but not limited to):  • Process form submissions (sign up, login, reviews, fault reports)  • Validate data such as email format, password strength, and fault reports before passing it to the model for storage.  • Respond to user actions (e.g., clicking on a hawker stall icon to view details) by updating the view with relevant data.

Our decision to implement the MVC design pattern was due to its ability to streamline data flow, manage complex user interactions, and support the evolving needs of our platform. In the following sections, we will explain the key reasons why we chose the MVC pattern and how it benefits HawkerStalk in terms of scalability, real-time data management, and multiuser functionality.

Firstly, the MVC pattern allows for excellent scalability and maintainability. As HawkerStalk grows and more features are introduced, like notifications or payment integrations, the structure provided by MVC allows us to add new components without disturbing the existing functionality. Each core part—model, view, and controller—can be modified independently, making the app easier to maintain and extend. The enhanced flexibility would reduce the risk of introducing bugs and makes it easier for developers to collaborate and manage different sections of the app.

Secondly, the MVC pattern can handle real-time data efficiently. HawkerStalk relies on upto-date information, like crowd levels at hawker stalls and the operating status of the stalls. With MVC, the model can retrieve and update real-time data from the database, while the controller ensures this data is delivered to the view immediately, allowing the app to stay dynamic and responsive. This means that users can always see the latest updates on stall activity, ensuring an interactive and engaging experience without delay.

Thirdly, the MVC pattern allows us to provide our two distinct user groups (customers and hawkers) distinct experiences in the app. This is necessary as both groups interact with the app in different ways. For example, hawkers can log in to update their stall's information, review customer feedback, or submit fault reports, while customers can search for stalls, submit reviews, and see real-time updates on stall activity. The controller in the MVC structure helps manage these various actions, ensuring that the right data is processed for each role. This flexibility allows HawkerStalk to cater to both user groups while maintaining a consistent and organized codebase.

# **Black Box Testing**

# 1. AuthController

Control class to test - AuthController

An AuthController (short for Authentication Controller) is a crucial component of the application's controller layer responsible for handling authentication-related tasks. The AuthController typically manages customer login, registration, logout, password reset, and customer verification processes.

- Customer Registration: Handles customer sign-up by validating and saving new customer information to the database, ensuring security practices like password hashing are followed.
- Customer Login: Manages customer login by verifying the customer credentials (email and password) and issuing a session token or JSON Web Token (JWT) upon successful authentication.
- Logout: Logs the customer out by invalidating the customer session or token, typically by deleting or marking it as expired.
- Password Reset: Initiates password reset procedures, often involving sending a reset link or token to the user's registered email address and allowing them to create a new password.
- **Email Verification:** Confirms the user's email address by sending a verification link, which the customer must click to activate their account.

This unique identifier becomes a key element in distinguishing and managing customer data. Additionally, if the role of the customer selected is Hawker, the system will require additional inputs such as Operating License, Operating Hours, Food Type.

# 2. Equivalence Class and Boundary Value Testing

#### **Equivalence Class Testing**

Equivalence Class Testing (ECT), also known as Equivalence Partitioning, is a Black Box Testing technique used in software testing to reduce the number of test cases. The goal of ECT is to divide input data into partitions, or equivalence classes, such that any test case within an equivalence class is expected to yield the same results. This method assumes that if one test case in a partition

passes, then all other cases in that partition will also pass; similarly, if one fails, others in that partition are likely to fail.

- **Identify Input Data:** Determine the input domain for the software or system under test.
- **Partition the Input:** Divide the input data into equivalence classes. Each partition should represent a set of **valid** or **invalid** inputs.
- **Select Representatives:** Choose one representative from each equivalence class as the test case. This saves time and effort, as it is assumed that all values within a partition behave similarly.
- **Design Tests:** Create test cases using these representatives to cover all identified equivalence classes.

Valid equivalence classes describe valid situations, and the system should handle them normally.

Invalid equivalence classes describe invalid situations, and the system should reject them.

# **Boundary Value Testing**

Boundary Value Testing (BVT), or Boundary Value Analysis, is a software testing technique focused on testing the boundaries of input ranges. The idea behind BVT is that errors often occur at the "edges" of input ranges, so testing the boundaries provides a higher chance of finding defects.

1. Login functions:

Valid Equivalence Class: Emails and passwords with correct formats.

**Invalid equivalence Class:** Emails and passwords with incorrect formats or missing information.

2. Sign- up functions:

**Valid Equivalence Class:** Email, Password, and Confirm Password with correct formats

**Invalid Equivalence Class:** Email, Password, and Confirm Password with incorrect formats or missing information

If domain selected is a Hawker:

**Valid Equivalence Class:** Email, Password, Confirm Password, and Operating Licences with correct formats

**Invalid Equivalence Class:** Email, Password, Confirm Password, and Operating Licences with incorrect formats or missing information

# 3. Test Cases and Results
